

Rural Sub Area Analysis

U.S. HIGHWAY 16 CORRIDOR STUDY

In 2019, the South Dakota Department of Transportation (SDDOT) initiated a study of over 16 miles of U.S. Highway 16 between Cathedral Drive/Fairmont Boulevard in Rapid City and the Keystone Wye to address growing traffic volumes and other transportation needs throughout the area. This study is a collaborative effort between the SDDOT, Federal Highway Administration (FHWA), Rapid City Area Metropolitan Planning Organization (RCAMPO), City of Rapid City, Pennington County, stakeholders, and the public to develop a comprehensive plan for the corridor.

STUDY AREA

Since the release of the U.S. Highway 16 Corridor Study final report in July 2021, the SDDOT identified a need for further detailed analysis and refinement of alternatives along a U.S. Highway 16 segment from just east of Rockerville to just west of the Neck Yoke Road intersection.

The purpose of this public open house is to present refined alternatives and updated analysis for public feedback. This feedback will help the study team further refine alternatives and develop preliminary recommendations to be presented at a future public open house.

Reduced Conflict Intersections (RCIs)

Nationwide, reduced conflict intersections (RCIs) are a proven safety countermeasure to reduce serious and fatal crashes caused by angle crashes at intersections. RCIs eliminate or reduce the highest risk movements of vehicles crossing multiple lanes of high-speed, high-volume traffic. Other benefits include simplifying navigation and traffic flow and decreasing intersection delay when turning from the side-street.

This sub-area analysis found that with increasing U.S. Highway 16 traffic volumes, a motorist turning left from the side-street would often be able to turn right, travel down to the U-turn, and back to the main intersection within an RCI quicker than finding adequate gaps in traffic to turn left within a traditional intersection.

A 2021 Minnesota Department of Transportation before and after study of 25 RCIs found a 70% reduction in fatal and serious injury crashes when RCIs were constructed. This included a 100% reduction in fatal and serious injury angle crashes.
